Pritchard's method was applied for the first time to haematological smears. A comparison is made with observations of other authors on the detection of glycogen in blood cells. The method described appeared to be one of the best available.

III. Klin. chorób Wewnętrznych Akad. Med., Krakow. * Lipidy w komórkach krwi. Lipids in the blood cells FOLIA BIOL. (Warsz.) 1953, 1/3 (209-221) Illus. 6

Cytochemical investigations on the lipids of blood cells, examined with the Sudan black B procedure, showed positive reactions for lipid substance chiefly in the cytoplasmic granule of granulocytes in all their developmental periods. Sudano-philic lipids were demonstrated in neutrophilic, eosinophilic and in certain basophilic granules. The behaviour of eosinophilic granules revealed their twofold structure, a fact which has been to some extent confirmed by electron microscopic examinations. Positive reactions for lipids have also been observed in cytoplasmic granules of monocytes, histiocytes and Ferrata cells. Blood cells of lymphatic and erythrocytic series displayed an almost entire lack of coloration.

Similarly the plasmocytes gave negative reactions. In megakaryocytes several types of lipid reactions were distinguished, depending on the platelet-forming activity of these cells. Attention was paid to differences appearing in pathological states. Hypotheses are presented pertaining to the rôle of lipids in the system of living cell matter and the rôle they play in different functional states of megakaryocytes. The possibility of the application of the Sudan black B reaction in haematological diagnosis is shown.

Abstract: [Authors' English summary] Three patients with leukemia, followed up for one year, are reported. All patients had a history of irradiation with large doses of x rays prior to onset of the disease. Attention should be drawn to careful diagnostic and therapeutic use of the ionizing radiation. The possibility of the x rays being a leukomogenic factor should always be borne in mind. Of the 19 cited references, only one (1) is Polish, and the others English.

AUTHOR: Blicharski, J. S.

TITLE: Fluorine spin-lattice relaxation in liquid CF sub 2 Cl sub 2

SOURCE: Acta physica polonica, v. 23, no. 5, 1963, 657-660

TOPIC TAGS: spin-lattice relaxation, CF sub 2 Cl sub 2, dipolar interaction, freon., freon 12, fluorine 19, anisotropic electronic shielding, spin-rotational interaction

ABSTRACT: The fluorine spin-lattice relaxation time T sub 1 at the resonant frequency 28 Mc/sec, was measured for pure CF sub 2 Cl sub 2 in the liquid state from -90C up to the critical temperature 112 C and in the gaseous state just above the critical temperature. T sub 1 generally increases with temperature for pure liquids of low viscosity. Notable exceptions are protons in liquid H sub 2, H sub 2 S, HCl, and isotope 19 of fluorine nuclei in liquid freons CHF sub 2 Cl and CHF sub 3 at higher temperatures. CH sub 2 Cl sub 2 (freon 12) was found to be another exception; its observed T sub 1 values decreased strongly with increasing temperature.

Card 1/12

68
66

L 14369-63

ACCESSION NR: AP3001825

Neglecting indirect scalar interactions, and writing the fluorine $1/T$ sub 1 in CF sub 2 Cl sub 2 as a sum of contributions resulting from spin-rotational interaction, dipole-dipole interaction and anisotropic electron shielding, respectively;

$$1/T \text{ sub } 1 = (1/T \text{ sub } 1) \text{ sub s.r. Plus } (1/T \text{ sub } 1) \text{ dip. Plus } (1/T \text{ sub } 1) \text{ sub shield.}$$

it was found that at high temperatures the relaxation process may be almost completely controlled by the spin-rotational (s.r.) interaction term, whereas at temperatures below -30C the dipolar contribution becomes important. In the range from -30C to the critical temperature the observed fluorine T sub 1 can be described by the empirical equation

$$T \text{ sub } 1 = 3.7 \times 10^6 T^{\text{sup } -3}$$

"The author wishes to thank Mr. T. Waluga for his assistance with some of the measurements".

Orig. article has 1 figure and 6 numbered equations.

ORIG. PUB. : Roczniki Chem, 32, No 5, 1121-1125 (1958)
ABSTRACT : The authors have investigated the conditions under which an exchange of labeled acetyl groups can take place in acyl monosaccharides in the absence of a catalyst. When 0.5 M solutions of acetylglucoses (AG) in glacial $\text{CH}_3\text{C}^{14}\text{OOH}$ are heated (118°, 11 hrs), isotope exchange is observed; the exchange does not affect the specific rotation. The radioactivity of β -AG subjected to isotope exchange is higher than that of α -AG under the same conditions. Elimination of

TITLE : Drying of Granular Materials in a Fluidized Bed
ORIG. PUB. : Magyar kem. lapja, 1958, 13, No 10-12, 113-117
ABSTRACT : Studies of the drying of 8 different granular materials in a fluidized bed, have shown that when rate of drying is determined by external diffusion, it rises with increased intensity of fluidizing (chalk, coke). If the rate of drying is affected not only by external diffusion, but also by other factors (internal diffusion, rate of emission of water of crystallization, as for example in the case of $\text{CaCl}_2 \cdot 2\text{H}_2\text{O}$), the rate of drying is defined by the semi-empirical equation: $dw/d\tau = kF(p_s - p_p) \cdot v$, wherein w -- moisture content in relation to dry air, in g/kg; τ -- time in hours; F -- drying surface in m^2/kg ; p_s -- equilibrium vapor pressure, in atmospheres; p_p -- partial vapor

AUTHORS: Blickle, Tibor and Németh, JenőTITLE: Fluidization Heat ExchangersPERIODICAL: Energia és Atomtechnika, 1960, Vol. 13, No. 12, pp. 557-559

TEXT: The article deals with heat-transfer processes in a fluidization apparatus and with the heat balance of such systems on the basis of the publications referred to and of the authors' own experiments. As regards the heat transfer between the solid granules fluidized and the gas, the authors are of the opinion that Kettenring's equation (Ref. 1) has no general validity. The authors made experiments on the fluidization of sodium sulfate granules and found that the heat-transfer coefficient between them and the gas may be calculated with good approximation from the equation

$$\frac{\alpha_{gr}}{c_{gr} \cdot G} \left(\frac{c_{gr} \mu}{\lambda_g} \right)^{2/3} = 1.77 \left[\frac{d_{gr} \cdot G}{\mu (1-\epsilon)} \right]^{-0.44}, \text{ where } \alpha_{gr} \text{ is the heat-transfer}$$

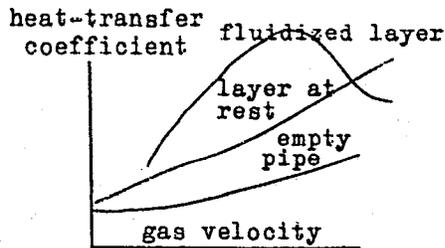

Card 1/4

B009/B057

coefficient between the granules and the gas; c_{gr} is the specific heat of the granules; μ is the viscosity of the fluid produced by fluidization; λ_g is the thermal conductivity of the gas; G is the quantity flowing through unit surface in unit time; d_{gr} is the diameter of the granules; and ϵ is the free-space factor. When the value of the expression between brackets exceeds 30, 5.7 stands for 1.77, and 0.78 for 0.44. The heat-transfer coefficient between the fluidized layer and the heat-transfer body is between 200 and 800 kcal/m²,h,C^o, if the thermal conductivity of the granules varies from 0.1 to 0.45

kcal/m, h, C^o. The annexed graph illustrates the variation of the heat-transfer coefficient with the velocity of flow in the case of an empty pipe, a layer at rest, and a fluidized layer. According to the authors' measurements, the heat carried away by the gas exerts the greatest influence on the process.

Fluidization Heat Exchangers

H/008/60/013/012/005/008
B009/B057

The coefficients of heat transfer between granules and gas and between the fluidized layer and the heat-transfer body placed in the latter depend very much on the sticking of the granules. If the granules are fed into

temperature
ratio

the apparatus from above and are discharged at its bottom, and the granules are heated by the hot gas, the temperature ratio of discharged gases to discharged granules depends very much on the mixing coefficient of the granules, as shown in the annexed graph. The fluidization process is used for the utilization of the heat content of waste gases for preheating cold gases. The authors calculated the heat balance of such an apparatus shown in the annexed Fig., and found it most efficient when the product of the quantity of gas and of its specific heat

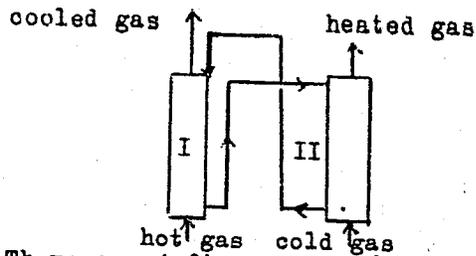

equaled the product of the quantity of granules and of their specific heat. The fluidized layer is used in many other heat transfer processes because of its fluid properties and good heat-transfer characteristics.

Determination of low-temperature viscosity of greases for railway-car axles. L. F. Bludchenko and V. N. Tishkova. *Abad. Nauk S.S.S.R., Otdel. 72th. Nash. Inst. Mashinosteniya, Sovershanie Vysokoi Zhidkosti i Kolloid. Rastvorov* (Conf. on Viscosity of Liquids and Colloidal Solns.) 2, 167-72(1944).--*Notes*. were made from 75 to -50° in an Ubbelohde viscometer; for oils of 20 (20), 500-3000, 1000-10000 poles, the Hg column pressures used were 100-180, 300-400, 400-500 mm., resp., the diam. of the capillary 2, 3, 4 mm., resp. All oils were previously heated to 10 M° for 10 min. prior to testing. Ten different samples of mixts. of mazout and solar and of tar and solar of various domestic origins, with η_{sp} between .55 and .60°, were investigated. Low-freezing lubricants are made by using as the low-viscosity component preferably light solar distillates of Baku paraffin-free petroleum, for the viscous component mazout of $E_{50} = 10.2^\circ$ and tar are preferred. Such mixts. show at -50° from 817 to 1050 poles and freeze at about -58°. The suitability of these lubricants was confirmed in expts. on a friction machine and in service on Siberian railroads. N. TITLE: Lubricating oil for bushings. Class 23, No. 184997

SOURCE: Izob reteniya, promyshlennyye obraztsey, tovarnyye znaki, no. 16, 1966, 73

TOPIC TAGS: lubricant, bushing, petroleum

ABSTRACT: An Author Certificate has been issued describing a lubricant for bushings, with a solar fraction and mazut base. To expand the operating temperature range of the oil, a petroleum fraction with a boil-away of 4-5% at 240-320C is added to the lubricant. This fraction is obtained from the petroleum distillate at 300-310C. [Translation] [NT]

The polytherm of the ternary system urea-potassium sulfate-water. V. P. Bidin (Nostov Machine Construction Inst.). J. Gen. Chem. (U.S.S.R.) 17, 1331-4 (1947) (in Russian).—The sections (I) (20% $\text{CO}(\text{NH}_2)_2$ + 80% H_2O) with varying K_2SO_4 , (II) (25% $\text{CO}(\text{NH}_2)_2$ + 75% H_2O) with varying K_2SO_4 , (III) (40% $\text{CO}(\text{NH}_2)_2$ + 60% H_2O) with varying K_2SO_4 , and (IV) (6% K_2SO_4 + 94% H_2O) with varying $\text{CO}(\text{NH}_2)_2$, are given in tables and in graphs. Observations were made by the visual method from 25° downwards. The eutectics are: I ice + K_2SO_4 , -8.6°, $\text{CO}(\text{NH}_2)_2$, 18.6, K_2SO_4 , 8.1; II $\text{CO}(\text{NH}_2)_2$ + K_2SO_4 , -7.6°, $\text{CO}(\text{NH}_2)_2$, 83.1, K_2SO_4 , 4.9; III $\text{CO}(\text{NH}_2)_2$ + K_2SO_4 , -6.3°, $\text{CO}(\text{NH}_2)_2$, 87.8, K_2SO_4 , 5.2; IV ice + $\text{CO}(\text{NH}_2)_2$, -13.4°, $\text{CO}(\text{NH}_2)_2$, 31.1, K_2SO_4 , 3.8. Whereas in sections I-III the rise beyond the min. is steep, section IV is almost identical with the binary system $\text{CO}(\text{NH}_2)_2$ - H_2O , i.e., K_2SO_4 has almost no effect on the soly. curve of $\text{CO}(\text{NH}_2)_2$. The field of K_2SO_4 occupies most of the polytherm. The ternary eutectic is at -13°, 31.5% $\text{CO}(\text{NH}_2)_2$, 4.9% K_2SO_4 .

Interaction of magnesium bromide with the bromides of rubidium and of lithium in aqueous solution. V. P. Bilin (Kuzov Machine Constr. Inst.). *J. Gen. Chem.* (U.S.S.R.) 17, 1500-4 (1947) (in Russian).--(1) The soly. of MgBr₂ at 25° is 80.38%, that of RbBr 83.38%. In the ternary system MgBr₂-RbBr-H₂O at 25°, no compds. or solid solns. are formed. The isotherm consists of a very extended RbBr branch and a much shorter MgBr₂.6H₂O branch, similar to the MgCl₂-NaCl-H₂O system. RbBr is almost completely salted out by the MgBr₂-satd. soln.; solns. of MgBr₂ 80.4 contain only traces of RbBr in equil. with RbBr + MgBr₂.6H₂O. Addn. of MgBr₂ to solns. of RbBr decreases sharply the soly. of the latter, e.g., in equil. with solid RbBr, solns. MgBr₂ 10.1, RbBr 41.5; MgBr₂ 40.2, RbBr 9.6. (2) The soly. of LiBr at 25° is 64.71%. The ternary MgBr₂-LiBr-H₂O consists of a rather short MgBr₂.6H₂O branch (down to MgBr₂ 25.3, LiBr 34.4), followed by a branch of solid solns., extending from MgBr₂ 20.0, LiBr 39.8, to pure LiBr. The solid phase in equil. with MgBr₂ 33.17, LiBr 2.90, is (in moles) 13.75 MgBr₂.4.41 LiBr.81.84H₂O; the solid in equil. with MgBr₂ 21.0, LiBr 39.8, is 10.51 MgBr₂.9.75 LiBr.79.71H₂O. These solid phases, obtained by isothermal crystn. of the corresponding solns., are more stable in air than the pure components. The system forms no compds. N. Thon
